

In all regions less snow than usual is lying. In particular at low and intermediate altitudes from a snow sport perspective, insufficient snow is lying.

The snowpack is faceted. The fresh wind slabs have bonded well with the old snowpack in all aspects in all altitude zones. The weather conditions facilitated a strengthening of the snowpack in all aspects.

In the last few days hardly any more avalanches were observed.

Skiability is good on very steep slopes in the south in the second part of the day, fair on cold slopes which are however very marked. Very often there is an alternation of more or less hard crusts, chalky snow with frozen sections and a few floury areas only in the most sheltered basins. In the bumps and near the ridges stones lurking.

Little/no snow in the lower parts: go up/down using the off roads.
